Wilhelm confesses to his brother-in-law the need “to become a public person and to please and influence in a larger circle.” Yet since he is no nobleman and as a bourgeois also does not want to make the vain effort merely to appear to be one, he seeks out the stage as a substitute, so to speak, for publicity. Here lies the secret of his theatrical mission: “On the boards a polished man appears in his splendor with personal accomplishments, just as he does so in the upper classes of society.” It may well be that it was the secret equivocation of the “cultured personality” (“the necessity I feel to cultivate my mental faculties and tastes”), the bourgeois intention in the figure projected as a nobleman, that permitted the equation of theatrical performance with public representation. But in turn the perception of the disintegration of the representative publicness in bourgeois society was so much on the mark and the inclination to belong to it nevertheless so strong that there must be more to the matter than a simple equivocation. Wilhelm came before his public as Hamlet, successfully at first. The public, however, was already the carrier of a different public sphere, one that no longer had anything in common with that of representation. In this sense Wilhelm Meister’s theatrical mission had to fail. It was out of step, as it were, with the bourgeois public sphere whose platform the theatre had meanwhile become. Beaumarchais’s Figaro had already entered the stage and along with him, according to Napoleon’s famous words, the revolution.

3 On the Genesis of the Bourgeois Public Sphere

With the emergence of early finance and trade capitalism, the elements of a new social order were taking shape. From the thirteenth century on they spread from the northern Italian city-states to western and northern Europe and caused the rise first of Dutch centers for staple goods (Bruges, Lüttich, Brussels, Ghent, etc.) and then of the great trade fairs at the crossroads of long-distance trade. Initially, to be sure, they were integrated without much trouble by the old power structure. That initial assimilation of bourgeois humanism to a noble courtly culture, as we observe it paradigmatically during the
rise of Florentine Renaissance society, must also be seen against this background. Early capitalism was conservative not only as regards the economic mentality so vividly described by Sombart (a characteristic way of doing business typified by "honorable" gain\textsuperscript{27}) but also as regards politics. As long as it lived from the fruits of the old mode of production (the feudal organization of agricultural production involving an enserfed peasantry and the petty commodity production of the corporatively organized urban craftsmen) without transforming it,\textsuperscript{28} it retained ambivalent characteristics. On the one hand this capitalism stabilized the power structure of a society organized in estates, and on the other hand it unleashed the very elements within which this power structure would one day dissolve. We are speaking of the elements of the new commercial relationships: the \textit{traffic in commodities and news} created by early capitalist long-distance trade.

The towns, of course, had local markets from the beginning. In the hands of the guilds and the corporations, however, these remained strictly regulated, serving more as instruments for the domination of the surrounding areas than for free commodity exchange between town and country.\textsuperscript{29} With the rise of long-distance trade, for which—according to Pirenne's observations—the town was only a base of operations, markets of a different sort arose. They became consolidated into periodic trade fairs and, with the development of techniques of capitalist financing (it is known that letters of credit and promissory notes were in use at the trade fairs of the Champagne as early as the thirteenth century), were established as stock exchanges. In 1531 Antwerp became a "permanent trade fair."\textsuperscript{30} This commercial exchange developed according to rules which certainly were manipulated by political power; yet a far-reaching network of horizontal economic dependencies emerged that in principle could no longer be accommodated by the vertical relationships of dependence characterizing the organization of domination in an estate system based upon a self-contained household economy. Of course, the political order remained unthreatened by the new processes which, as such, had no place in the existing framework, as long as the members of the old ruling stratum participated in them only as consumers.
When they earmarked an increasing portion of what was produced on their lands for the acquisition of luxury goods made available through long-distance trade, this by itself did not bring traditional production—and hence the basis of their rule—into dependence on the new capital.

The traffic in news that developed alongside the traffic in commodities showed a similar pattern. With the expansion of trade, merchants' market-oriented calculations required more frequent and more exact information about distant events. From the fourteenth century on, the traditional letter carrying by merchants was for this reason organized into a kind of guild-based system of correspondence for their purposes. The merchants organized the first mail routes, the so-called ordinary mail, departing on assigned days. The great trade cities became at the same time centers for the traffic in news; the organization of this traffic on a continuous basis became imperative to the degree to which the exchange of commodities and of securities became continuous. Almost simultaneously with the origin of stock markets, postal services and the press institutionalized regular contacts and regular communication. To be sure, the merchants were satisfied with a system that limited information to insiders; the urban and court chanceries preferred one that served only the needs of administration. Neither had a stake in information that was public. What corresponded to their interests, rather, were “news letters,” the private correspondences commercially organized by newsdealers. The new sector of communications, with its institutions for a traffic in news, fitted in with the existing forms of communication without difficulty as long as the decisive element—publicness—was lacking. Just as, according to Sombart’s definition, one could speak of “mail” only when the regular opportunity for letter dispatch became accessible to the general public, so there existed a press in the strict sense only once the regular supply of news became public, that is, again, accessible to the general public. But this occurred only at the end of the seventeenth century. Until then the traditional domain of communication in which publicity of representation held sway was not fundamentally threatened by the new domain of a public sphere whose decisive mark was the published word.
There was as yet no publication of commercially distributed news; the irregularly published reports of recent events were not comparable to the routine production of news.35

These elements of early capitalist commercial relations, that is, the traffic in commodities and news, manifested their revolutionary power only in the mercantilist phase in which, simultaneously with the modern state, the national and territorial economies assumed their shapes.36 When in 1597 the German Hanse was definitively expelled from London, and when a few years later the Company of Merchant Adventurers established itself in Hamburg, this signified not merely the economic and political ascendancy of Great Britain but an altogether new stage of capitalism. From the sixteenth century on merchant companies were organized on an expanded capital basis; unlike the old traders in staple goods, they were no longer satisfied with limited markets. By means of grand expeditions they opened up new markets for their products.37 In order to meet the rising need for capital and to distribute the growing risks, these companies soon assumed the form of stock companies. Beyond this, however, they needed strong political guarantees. The markets for foreign trade were now justly considered "institutional products"; they resulted from political efforts and military force. The old home towns were thus replaced as bases of operations by the state territory. The process that Heckscher describes as the nationalization of the town-based economy began.38 Of course, within this process was constituted what has since been called the “nation”—the modern state with its bureaucracies and its increasing financial needs. This development in turn triggered a feedback that accelerated mercantilist policy. Neither private loans made to the prince by financiers nor public borrowing were sufficient to cover these needs; only an efficient system of taxation met the demand for capital. The modern state was basically a state based on taxation, the bureaucracy of the treasury the true core of its administration. The separation precipitated thereby between the prince's personal holdings and what belonged to the state39 was paradigmatic of the objectification of personal relations of domination. Local administrations were brought under the control of the state, in Great Britain through the
institution of the Justice of the Peace, on the continent, after the French model, with the help of superintendents.

The reduction in the kind of publicity involved in representation that went hand in hand with the elimination of the estate-based authorities by those of the territorial ruler created room for another sphere known as the public sphere in the modern sense of the term: the sphere of public authority. The latter assumed objective existence in a permanent administration and a standing army. Now continuous state activity corresponded to the continuity of contact among those trafficking in commodities and news (stock market, press). Public authority was consolidated into a palpable object confronting those who were merely subject to it and who at first were only negatively defined by it. For they were the private people who, because they held no office, were excluded from any share in public authority. "Public" in this narrower sense was synonymous with "state-related"; the attribute no longer referred to the representative "court" of a person endowed with authority but instead to the functioning of an apparatus with regulated spheres of jurisdiction and endowed with a monopoly over the legitimate use of coercion. The manorial lord's feudal authority was transformed into the authority to "police"; the private people under it, as the addressees of public authority, formed the public.

The relation between authorities and subjects took on a peculiar character as a result of mercantilist policies, policies formally oriented to the maintenance of an active balance of trade. It is a familiar story how the opening up and expansion of markets for foreign trade, in which the privileged companies managed to attain monopolistic control through political pressure—in a word, the new colonialism—step by step began to serve the development of a commercial economy at home. In parallel fashion the interests of capitalists engaged in manufacture prevailed over those engaged in trade. In this way one element of the early capitalist commercial system, the trade in commodities, brought about a revolution, this time in the structure of production as well. The exchange of imported raw materials for finished and semi-finished domestic goods must be viewed as a function of the process in which the old mode
of production was transformed into a capitalist one. Dobb remarks on how this shift was reflected in the mercantilist literature of the seventeenth century. Foreign trade no longer counted per se as the source of wealth, but only insofar as it aided the employment of the country's population—employment created by trade. Administrative action was increasingly oriented to this goal of the capitalist mode of production. The privileges granted to occupation-based corporations characterizing the estate regime were replaced by royal grants of personal privileges and were aimed at transforming extant manufacture into capitalist production or at creating new manufacturing enterprises altogether. Hand in hand with this went the regulation of the process of production itself, down to the last detail.\(^{11}\)

Civil society came into existence as the corollary of a depersonalized state authority. Activities and dependencies hitherto relegated to the framework of the household economy emerged from this confinement into the public sphere. Schumpeter's observation "that the old forms that harnessed the whole person into systems of supraindividual purpose had died and that each family's individual economy had become the center of its existence, that therewith a private sphere was born as a distinguishable entity in contrast to the public"\(^{11}\) only captures one side of the process—the privatization of the process of economic reproduction. It glances over the latter's new "public" relevance. The economic activity that had become private had to be oriented toward a commodity market that had expanded under public direction and supervision; the economic conditions under which this activity now took place lay outside the confines of the single household; for the first time they were of general interest. Hannah Arendt refers to this private sphere of society that has become publicly relevant when she characterizes the modern (in contrast to the ancient) relationship of the public sphere to the private in terms of the rise of the "social": "Society is the form in which the fact of mutual dependence for the sake of life and nothing else assumes public significance, and where the activities connected with sheer survival are permitted to appear in public."\(^{13}\)

The changed conditions of the times were reflected in the
The transformation of the economics handed down from antiquity into political economy. Indeed the term “economic” itself, which until the seventeenth century was limited to the sphere of tasks proper to the oikodespotes, the pater familias, the head of the household, now, in the context of a practice of running a business in accord with principles of profitability, took on its modern meaning. The duties of the household head were narrowed and “economizing” became more closely associated with thriftiness. Modern economics was no longer oriented to the oikos; the market had replaced the household, and it became “commercial economics” (Kommerzienwirtschaft). Significantly, in eighteenth-century cameralism (whose name derives from camera, the territorial ruler’s treasure chamber) this forerunner of political economy was part of “police-science,” that is, of administrative science proper, together with the science of finance on the one hand and with agricultural technology on the other (which was becoming differentiated from traditional economics). This shows how closely connected the private sphere of civil society was to the organs of the public authority.

Within this political and social order transformed during the mercantilist phase of capitalism (and whose new structure found its expression precisely in the differentiation of its political and social aspects) the second element of the early capitalist commercial system, the press, in turn developed a unique explosive power. The first journals in the strict sense, ironically called “political journals”, appeared weekly at first, and daily as early as the middle of the seventeenth century. In those days private correspondence contained detailed and current news about Imperial Diets, wars, harvests, taxes, transports of precious metals, and, of course, reports on foreign trade. Only a trickle of this stream of reports passed through the filter of these “news letters” into printed journals. The recipients of private correspondence had no interest in their contents becoming public. On the one hand, therefore, the political journals responded to a need on the part of the merchants; on the other hand, the merchants themselves were indispensable to the journals. They were called custodes novellarum among their contemporaries precisely because of this dependence of public
reporting upon their private exchange of news. It was essentially news from abroad, of the court, and of the less important commercial events that passed through the sieve of the merchants' unofficial information control and the state administrations' official censorship. Certain categories of traditional "news" items from the repertoire of the broadsheets were also perpetuated—the miracle cures and thunderstorms, the murders, pestilences, and burnings. Thus, the information that became public was constituted of residual elements of what was actually available; nevertheless, it requires explanation why at this particular time they were distributed and made generally accessible, made public at all. It is questionable whether the interests of those who made a living by writing news pamphlets would have provided a sufficiently strong impetus; still, they did have an interest in publication. For the traffic in news developed not only in connection with the needs of commerce; the news itself became a commodity. Commercial news reporting was therefore subject to the laws of the same market to whose rise it owed its existence in the first place. It is no accident that the printed journals often developed out of the same bureaus of correspondence that already handled handwritten newsletters. Each item of information contained in a letter had its price; it was therefore natural to increase the profits by selling to more people. This in itself was already sufficient reason periodically to print a portion of the available news material and to sell it anonymously, thus giving it publicity.

The interest of the new (state) authorities (which before long began to use the press for the purposes of the state administration), however, was of far greater import. Inasmuch as they made use of this instrument to promulgate instructions and ordinances, the addressees of the authorities' announcements genuinely became "the public" in the proper sense. From the very beginning, the political journals had reported on the journeys and returns of the princes, on the arrival of foreign dignitaries, on balls, "special events" (Solemnitäten) at court, appointments, etc.; in the context of this news from the Court, which can be thought of as a kind of transposition of the publicity of representation into the new form of public sphere,
there also appeared “sovereign ordinances in the subjects’ best interest.” Very soon the press was systematically made to serve the interests of the state administration. As late as March 1769 a press ordinance of the Vienna government witnessed the style of this practice: “In order that the writer of the journal might know what sort of domestic decrees, arrangements, and other matters are suitable for the public, such are to be compiled weekly by the authorities and are to be forwarded to the editor of the journal.” As we know from the letters of Hugo Grotius, then Swedish emissary in Paris, Richelieu already possessed a lively sense of the usefulness of the new instrument. He was a patron of the Gazette established in 1631 by Renaudot, which served as the model for the Gazette of London that appeared from 1665 on under Charles II. Two years earlier the officially authorized Intelligencer had appeared in London, itself preceded by the Daily Intelligencer of Court, City, and County that sporadically appeared as early as 1643. Everywhere these advertisers, which first arose in France as aids to address agencies or intelligence agencies, became the preferred instruments of governments. Many times the intelligence agencies were taken over by governments, and the advertisers changed into official gazettes. According to an order of 1727 by the Prussian cabinet, this institution was intended “to be useful for the public” and to “facilitate communication.” Besides the decrees and proclamations “in police, commerce, and manufacture” there appeared the quotations of the produce markets, of the taxes on food items, and generally of the most important prices of domestic and imported products; in addition, stock market quotations and trade reports and reports on water levels were published. Accordingly, the Palatine-Bavarian government could announce to the “commercial public” an advertiser “in the service of trade and the common man, so that he can inform himself both about the decrees that from time to time are issued by the King and about the prices of various commodities so that he can sell his merchandise at a better price.”

The authorities addressed their promulgations to “the” public, that is, in principle to all subjects. Usually they did not reach the “common man” in this way, but at best the “educated classes.” Along with the apparatus of the modern state, a new
stratum of "bourgeois" people arose which occupied a central position within the "public." The officials of the rulers' administrations were its core—mostly jurists (at least on the continent, where the technique of the received Roman law was adopted as an instrument for the rationalization of social organization). Added to them were doctors, pastors, officers, professors, and "scholars," who were at the top of a hierarchy reaching down through schoolteachers and scribes to the "people." 53

For in the meantime the genuine "burghers," the old occupational orders of craftsmen and shopkeepers, suffered downward social mobility; they lost their importance along with the very towns upon whose citizens' rights their status was based. At the same time, the great merchants outgrew the confining framework of the towns and in the form of companies linked themselves directly with the state. Thus, the "capitalists," the merchants, bankers, entrepreneurs, and manufacturers (at least where, unlike in Hamburg, the towns could not maintain their independence from the territorial rulers) belonged to that group of the "bourgeois" who, like the new category of scholars, were not really "burghers" in the traditional sense. 54 This stratum of "bourgeois" was the real carrier of the public, which from the outset was a reading public. Unlike the great urban merchants and officials who, in former days, could be assimilated by the cultivated nobility of the Italian Renaissance courts, they could no longer be integrated in toto into the noble culture at the close of the Baroque period. Their commanding status in the new sphere of civil society led instead to a tension between "town" and "court," whose typical form in different nations will concern us later. 55

In this stratum, which more than any other was affected and called upon by mercantilist policies, the state authorities evoked a resonance leading the publicum, the abstract counterpart of public authority, into an awareness of itself as the latter's opponent, that is, as the public of the now emerging public sphere of civil society. For the latter developed to the extent to which the public concern regarding the private sphere of civil society was no longer confined to the authorities but was considered by the subjects as one that was properly theirs. Besides the carriers of commercial and finance capitalism, a growing group
of entrepreneurs, manufacturers, and factory owners became dependent upon measures taken by the state administration whose intent certainly was not merely that of controlling commercial-entrepreneurial activity but also of encouraging initiative through regulation. Mercantilism did not at all, as widespread prejudice would have it, favor state enterprise; rather, its commercial policy, albeit in a bureaucratic fashion, promoted the establishment and dissolution of private businesses run in a capitalist manner. The relationship between the authorities and the subjects thereby assumed the peculiar ambivalence of public regulation and private initiative. In this way the zone in which public authority, by way of continuous administrative acts, maintained contact with private people, was rendered problematic. This in fact involved a wider circle of persons than those participating directly in capitalist production. To the degree to which the latter became pervasive, the number of self-sufficient economic units shrunk and the dependence of local markets upon regional and national ones grew. Accordingly, broad strata of the population, especially in the towns, were affected in their daily existence as consumers by the regulations of mercantilist policy. Not the notorious dress codes but taxes and duties and, generally, official interventions into the privatized household finally came to constitute the target of a developing critical sphere. When there was a scarcity of wheat, bread consumption on Friday evenings was prohibited by official decree. Because, on the one hand, the society now confronting the state clearly separated a private domain from public authority and because, on the other hand, it turned the reproduction of life into something transcending the confines of private domestic authority and becoming a subject of public interest, that zone of continuous administrative contact became "critical" also in the sense that it provoked the critical judgment of a public making use of its reason. The public could take on this challenge all the better as it required merely a change in the function of the instrument with whose help the state administration had already turned society into a public affair in a specific sense—the press.

As early as in the last third of the seventeenth century journals were complemented by periodicals containing not primar-
ily information but pedagogical instructions and even criticism and reviews. At first there were scholarly periodicals speaking to the circle of educated laymen: Denys de Sallo’s *Journal des Savants* of 1665, Otto Mencken’s *Acta Eruditorum* of 1682, and finally the famous *Monatsgespräche* of 1688 by Thomasius; these forged the model for an entire genre of periodicals. In the course of the first half of the eighteenth century, in the guise of the so-called learned article, critical reasoning made its way into the daily press. When, from 1729 on, the *Hallenser Intelligenzblatt*, besides the usual material contained in advertisers also published learned articles, book reviews, and occasionally “a historical report sketched by a professor and relevant to current events,” the Prussian King was moved to take the development into his own hands. Even the use of one’s own reason as such was subjected to regulation. All chaired professors of the faculties of law, medicine, and philosophy were to take turns in “submitting to the editor of the gazette, expeditiously and no later than Thursday, a special note, composed in a pure and clear style of writing.” In general “the scholars were to inform the public of useful truths.” In this instance the bourgeois writers still made use of their reason at the behest of the territorial ruler; soon they were to think their own thoughts, directed against the authorities. In a rescript of Frederick II from 1784 one reads: “A private person has no right to pass public and perhaps even disapproving judgment on the actions, procedures, laws, regulations, and ordinances of sovereigns and courts, their officials, assemblies, and courts of law, or to promulgate or publish in print pertinent reports that he manages to obtain. For a private person is not at all capable of making such judgment, because he lacks complete knowledge of circumstances and motives.” A few years before the French Revolution, the conditions in Prussia looked like a static model of a situation that in France and especially in Great Britain had become fluid at the beginning of the century. The inhibited judgments were called “public” in view of a public sphere that without question had counted as a sphere of public authority, but was now casting itself loose as a forum in which the private people, come together to form a public, readied themselves to compel public authority to legitimize itself before public opin-
The publicum developed into the public, the subjectum into the [reasoning] subject, the receiver of regulations from above into the ruling authorities' adversary.

The history of words preserved traces of this momentous shift. In Great Britain, from the middle of the seventeenth century on, there was talk of "public," whereas until then "world" or "mankind" was usual. Similarly, in France le public began to denote what in the eighteenth century, according to Grimm's Wörterbuch, also gained currency throughout Germany as Publikum (its use spreading from Berlin). Until then one spoke of the "world of readers" (Lesewelt), or simply of the "world" (Welt) in the sense still used today: all the world, tout le monde. Adelung draws a distinction between the public that gathered as a crowd around a speaker or actor in a public place, and the Lesewelt (world of readers). Both, however, were instances of a "critical (richtend) public." Whatever was submitted to the judgment of the public gained Publizität (publicity). At the end of the seventeenth century the English "publicity" was borrowed from the French publicité; in Germany the word surfaced in the eighteenth century. Criticism itself was presented in the form of öffentliche Meinung, a word formed in the second half of the eighteenth century in analogy to opinion publique. In Great Britain "public opinion" arose at about the same time; the expression "general opinion," however, had been in use long before.
