
Preface

This monograph grew out of my dissertation (Herburger 1997b). Chapters 1, 2, 3, and 5 stem from that work, but have been substantially revised. Chapter 4 was written following a reviewer's suggestion and is entirely new. The phenomenon discussed in chapter 5 (focus-affected readings of determiners) is also discussed in Herburger 1997a. The description of the data remains the same, but the analysis that I give here differs in several ways.

In my attempt to describe focus and how it interacts with quantification I have received help from many sides. My deepest gratitude goes to Barry Schein. His comments and answers to my countless questions have been of tremendous help. While writing my thesis, I also benefited from the generous feedback I received from other linguists, especially Kai von Stechow, Irene Heim, Norbert Hornstein, Richard Larson, Renate Musan, Orin Percus, Tim Stowell, Anna Szabolcsi, and Jean-Roger Vergnaud. The suggestions of two reviewers for MIT Press aided and guided me in preparing this monograph, as did many hours of discussions with Paul Pietroski, Paul Portner, and Juan Uriagereka. Regine Eckardt's careful review of my dissertation in *Glott International* 3 gave me a further sense of what needed more work and clarification. I also appreciate the assistance I received from Laura Barker, who helped me with the research on *even*, and the input of those who participated in my classes on the definiteness effect (spring 1998) and on focus (fall 1998) at Georgetown University; they gave me an opportunity to try out and rethink some of the ideas discussed in this monograph. Finally, I want to thank Amy Brand for her patience and support and Anne Mark for her meticulous copy-editing, which has greatly improved the readability (and in some places the literal content) of what follows.
