## Acknowledgments

There are many people to thank for making this book possible. Above all, it would not have been possible without the ongoing support of Morris Halle. As the present book grew by successive iteration from a modest discussion paper written five years ago, he carefully read and commented on each version. Arguing with him over that period about the matters the book discusses has been a real pleasure. Since there are several key aspects of the analysis that I have still not managed to convince him of, I have many more years of spirited argument to look forward to.

Issues of computation and representation that Sam Gutmann and I have discussed over the last dozen years underlie the entire approach taken here. In addition to helping develop the perspective, he contributed many specific comments, as well as encouragement and support.

Since I devote several pages in what follows to showing that he did not get it right, I am glad to have the opportunity at the outset to acknowledge the contribution of Eric Raimy. His dissertation showed that a derivational solution to the problems posed by reduplication was possible. It reminded us that most of the crucial advances in phonological theory are advances in understanding the structure of phonological representations.

Thanks to audiences at MIT's "Morph Beer" and Phonology Circle, the Chicago Linguistic Society, and the 2002 Graz Reduplication Conference for their interest in and comments on earlier versions of portions of this material. Thanks also to many individuals for helpful discussion and other assistance: Sylvain Bromberger, Terry Crowley, Stuart Davis, Justin Fitzpatrick, Larry Hagberg, Ken Hale, Sheldon Harrison, Mashudi Bin Kader, Michael Kenstowicz, Brett Kessler, Alec Marantz, Ngessimo Mutaka, Andrew Nevins, Eric Raimy, Galen

Sibanda, Suzanne Urbanczyk, and Alan Yu.

I also owe a debt to the many people responsible for developing PSTricks, the TeX software that allowed me to depict the autosegmental representations that are fundamental to the theory that I propose. Herbert Voss, its current maintainer and developer, and Timothy Van Zandt, the original author of PSTricks, deserve special thanks. I have long thought that the difficulty in depicting complex structures has had a negative impact on the development of theories of linguistic computation. Advances in typesetting tools will help free up linguists to pursue more thoroughly autosegmental approaches to phonology. I also owe a debt to Rei Fukui, who constructed the phonetic fonts (TIPA) which I relied on.
