Preface to the Second Edition xiii

Preface to the First Edition xv

List of Acronyms xix

1 Introduction 1

1.1 What Is fMRI? 4

1.2 The Scanning Session 5

1.3 Data Analysis 7

1.4 Software Packages 8

2 Data Formats 11

2.1 Some Commonly Used Data Formats 12

2.1.1 DICOM 12

2.1.2 Analyze 13

2.1.3 NIfTI 14

2.1.4 MINC 14

2.1.5 BIDS 14

2.2 Converting from One Format to Another 15

2.3 Reading fMRI Data into MATLAB 15

3 Modeling the BOLD Response 17

3.1 Linear Models of the BOLD Response 17

3.2 Methods of Estimating the hrf 23

3.2.1 Input an Impulse, and Observe the Response 23

3.2.2 Open the Box; Study the Circuit 24

3.2.3 Take a Guess 24

3.2.4 Select a Flexible Mathematical Model of the hrf 26

3.2.5 Deconvolution 35

3.3 Nonlinear Models of the BOLD Response 38

3.4 Conclusions 42

4 Experimental Designs 45

4.1 Organizing and Presenting Stimulus Events 45

4.1.1 Block Designs 45

4.1.2 Slow Event-Related Designs 49

4.1.3	Rapid Event-Related Designs	50
4.1.4	Free-Behavior Designs	51
4.1.5	Resting-State fMRI	52
4.2	Choosing the Right Experimental Conditions	53
4.2.1	The Method of Subtraction	53
4.2.2	Conjunction Analysis Designs	55
4.2.3	Factorial Designs and the Additive Factor Method	57
4.2.4	Parametric Designs	59
4.2.5	Repetition Suppression Designs	60
4.3	Conclusions	61
5	Preprocessing	63
5.1	Slice-Timing Correction	64
5.1.1	Slice-Timing Correction during Preprocessing	65
5.1.2	Slice-Timing Correction during Task-Related Statistical Analysis	71
5.2	Head Motion Correction	72
5.2.1	Correcting for Motion-Induced Location Changes	73
5.2.2	Motion-Induced Changes in the BOLD Response	80
5.3	Coregistering the Functional and Structural Data	83
5.4	Normalization	88
5.4.1	Brain Atlases	88
5.4.2	The Spatial Normalization Process	89
5.5	Spatial Smoothing	92
5.6	Temporal Filtering	97
5.7	Other Preprocessing Steps	102
5.7.1	Quality Assurance	102
5.7.2	Distortion Correction	102
5.7.3	Grand Mean Scaling	103
5.8	Conclusions	104
6	The General Linear Model	105
6.1	The Correlation Approach	106
6.2	Collinearity	111
6.3	Accounting for Nuisance Effects	115
6.4	The FBR Method	117
6.5	Microlinearity versus Macrolinearity	122
6.6	Block Designs	123
6.7	A Graphical Convention for Displaying the Design Matrix	125
6.8	An Introduction to the General Linear Model	126
6.9	Parameter Estimation in the Correlation and FBR Models	130
6.10	Testing a Hypothesis by Constructing Statistical Parametric Maps	132
6.10.1	Tests of One Linear Hypothesis	132
6.10.2	Tests of Multiple Linear Hypotheses	139
6.10.3	Testing a Nonlinear Hypothesis	140
6.11	The Multivariate GLM	142
6.12	Nonparametric Approaches to Hypothesis Testing	145
6.12.1	Algorithm for Hypothesis Testing with a Permutation Test	145

6.13	Percent Signal Change	146
6.14	Comparing the Correlation and FBR Methods	149
6.15	Derivations of Propositions 6.1–6.3	151
6.15.1	Proposition 6.1	151
6.15.2	Proposition 6.2	152
6.15.3	Proposition 6.3	153
7	The Multiple Comparisons Problem	155
7.1	The Sidak and Bonferroni Corrections	156
7.2	Using Gaussian Random Fields (GRFs) to Make Single-Voxel Corrections	158
7.3	Using GRFs to Correct at the Cluster Level	166
7.3.1	Cluster-Based Methods Using a Spatial Extent Criterion	170
7.3.2	Cluster-Based Methods Using a Criterion That Depends on Cluster Height and Spatial Extent	171
7.4	Permutation-Based Solutions to the Multiple Comparisons Problem	174
7.4.1	Permutation-Based Algorithm for Finding the Threshold T That Leads to an Experiment-Wise Error Rate of α_E When Decisions Are Made at the Single-Voxel Level	175
7.4.2	Permutation-Based Algorithm for Finding the Threshold S on Cluster Size That Leads to an Experiment-Wise Error Rate of α_E When Cluster-Based Decisions Are Made	175
7.5	Comparing the Various Methods	176
7.6	False Discovery Rate	178
7.6.1	Benjamini and Hochberg (1995) Algorithm for Ensuring That $FDR \leq q$	179
7.7	Voodoo Correlations	182
7.8	Conclusions	183
7.9	Derivations	183
7.9.1	Proposition 7.1	183
7.9.2	Proposition 7.2	184
7.9.3	Proposition 7.3	185
7.9.4	Proposition 7.4	185
7.9.5	Worsley et al. (1996) Algorithm for Computing Resel Counts (i.e., R_d)	186
7.9.6	Why the FDR Algorithm Works	188
8	Group Analyses	191
8.1	Individual Differences	191
8.2	Fixed versus Random Factors in the General Linear Model	194
8.3	A Fixed-Effects Group Analysis	196
8.4	A Random-Effects Group Analysis	201
8.5	Comparing Fixed-Effects and Random-Effects Analyses	203
8.6	Multiple-Factor Experiments	205
8.7	Power Analysis	208
8.8	Meta-Analysis	213
8.9	Derivations	218
8.9.1	Proposition 8.1	218
8.9.2	Proposition 8.2	219

- 9 Functional Connectivity Analysis via Psychophysiological Interactions and Beta-Series Regression 221**
 - 9.1 The Method of Psychophysiological Interactions (PPI) 224
 - 9.1.1 Selecting a Seed 224
 - 9.1.2 PPI in Block Designs 225
 - 9.1.3 PPI in Rapid Event-Related Designs 231
 - 9.2 Beta-Series Regression 233
 - 9.3 Conclusions 241

- 10 Functional Connectivity Analysis via Granger Causality 243**
 - 10.1 Quantitative Measures of Causality 250
 - 10.2 Parameter Estimation 253
 - 10.3 Inference 257
 - 10.4 Conditional Granger Causality 258
 - 10.5 Theoretical Extensions 265
 - 10.6 Validity 266
 - 10.6.1 Is the Temporal Resolution of fMRI Good Enough for Granger Causality? 267
 - 10.6.2 Do Interregional Timing Differences in the hrf Invalidate Granger Causality? 267
 - 10.7 Software Packages 268
 - 10.8 Derivation of Proposition 10.1 268

- 11 Assessing Functional Connectivity via Coherence Analysis 269**
 - 11.1 Autocorrelation and Cross-Correlation 269
 - 11.2 Power Spectrum and Cross-Power Spectrum 274
 - 11.3 Coherence 278
 - 11.3.1 Coherence in Rapid versus Slow Event-Related Designs 284
 - 11.3.2 An Empirical Application 288
 - 11.3.3 Hypothesis Testing 290
 - 11.4 Partial Coherence 290
 - 11.5 Using the Phase Spectrum to Determine Causality 293
 - 11.6 Conclusions 299
 - 11.7 Derivations 300
 - 11.7.1 Proposition 11.1 300
 - 11.7.2 Proposition 11.2 300

- 12 Principal Component Analysis 303**
 - 12.1 Principal Component Analysis 304
 - 12.2 PCA with fMRI Data 307
 - 12.3 Using PCA to Eliminate Noise 309
 - 12.3.1 Algorithm for Eliminating Noise from fMRI Data 311
 - 12.4 Singular-Value Decomposition 315
 - 12.5 Conclusions 318

- 13 Independent Component Analysis 319**
 - 13.1 The Cocktail-Party Problem 320
 - 13.2 Applying ICA to fMRI Data 320

13.2.1	Spatial ICA	322
13.2.2	Assessing Statistical Independence	324
13.2.3	The Importance of Nonnormality in ICA	325
13.2.4	Preparing Data for ICA	326
13.3	ICA Algorithms	328
13.3.1	Minimizing Mutual Information	328
13.3.2	Methods That Maximize Nonnormality	330
13.3.3	Maximum Likelihood Approaches	332
13.3.4	Infomax	333
13.4	Interpreting ICA Results	336
13.4.1	Determining the Relative Importance of Each Component	336
13.4.2	Assigning Meaning to Components	337
13.5	The Noisy ICA Model	340
13.6	Other Issues	345
13.7	Group ICA	346
13.8	Comparing ICA and GLM Approaches	347
13.9	Conclusions	349
13.10	Derivations	350
13.10.1	Why Whitening Reduces the Number of Free Parameters in the ICA Model	350
13.10.2	The Infomax Learning Algorithm	351
14	Decoding via Multivoxel Pattern Analysis	353
14.1	General Overview of MVPA	353
14.2	Determining the Search Region and the Curse of Dimensionality	355
14.3	Creating the Activity Vectors	360
14.4	Preprocessing for MVPA	364
14.5	Building a Classifier	366
14.5.1	Fisher Linear Discriminant Analysis	370
14.5.2	Support Vector Machines	371
14.6	Validation	373
14.7	Statistical Inference	376
14.7.1	Individual-Subject Analysis	376
14.7.2	Group-Level Inference	377
14.8	Feature Selection	379
14.9	MVPA Software	380
14.10	Conclusions	381
14.11	Description of the SVM Algorithm That Maximizes the Margin	382
14.11.1	Linear SVMs	382
14.11.2	Nonlinear SVMs	386
15	Encoding Models	389
15.1	Voxel-Based Encoding Models	390
15.2	Inverting an Encoding Model to Produce a Decoding Scheme	397
15.3	Model-Based fMRI	400
15.4	Computational Cognitive Neuroscience	403
15.5	Conclusions	405

16	Dynamic Causal Modeling	407
16.1	Linear Dynamical Models of Neural Activation	408
16.2	Bilinear Dynamical Models of Neural Activation	412
16.3	Generalizations of the Bilinear Model	419
16.3.1	Quadratic DCM	419
16.3.2	Two-State DCM	420
16.3.3	Stochastic DCM	421
16.4	The Hemodynamic Model	422
16.5	Parameter Estimation	423
16.6	Model Selection	429
16.6.1	Model Selection by Minimizing BIC	438
16.6.2	Model Selection by Maximizing Negative Free Energy	439
16.7	Group Analysis	442
16.7.1	Fixed-Effects DCM Analyses	442
16.7.2	Random-Effects DCM Analyses	443
16.8	Conclusions	445
16.9	Derivation of Negative Free Energy	446
17	Representational Similarity Analysis	453
17.1	Extracting an RDM from the BOLD Data	455
17.1.1	Selecting the ROI	455
17.1.2	Estimating Activity Vectors	456
17.1.3	Computing Dissimilarity between Activity Vectors	457
17.2	Building a Geometric Model of the Similarity Structure	462
17.3	Perceived Similarity in Humans	467
17.4	Group-Level Inference with RSA	470
17.5	Encoding and Decoding Using Representational Similarity	475
17.6	RSA Software	477
17.7	Conclusions	477
	Appendix A. Matrix Algebra	479
A.1	Matrices and Their Basic Operations	479
A.2	Rank	486
A.3	Solving Linear Equations	488
A.4	Eigenvalues and Eigenvectors	492
A.4.1	Definitions	492
A.4.2	Properties	495
	Appendix B. Multivariate Probability Distributions	499
B.1	Introduction	499
B.2	Multivariate Normal Distributions	500
	Appendix C. Building a Design Matrix for Group Analysis	505
C.1	Effect Coding	505
C.2	Statistical Testing	509
	Notes	513
	References	521
	Index	539
