

Contents

Preface xi

1 *First Steps* 1

- Why we study movement 4
- The Cybathlon 8
- Tools to study movement 11
- Overview of this book 15
- Language of movement 16

Part I *Locomotion*

2 *Walking* 25

- The walking gait cycle 26
- Ground reaction forces 28
- Ballistic walking model 33
- The Froude number 34
- Cost of transport 37
- Dynamic walking model 39
- Arm swing 42
- Skeletal model for gait analysis 44
- Kinematics of walking 46
- Ground reaction forces and walking speed 48
- Atypical gait 49
- Changes in walking under various conditions 52

3 *Running* 55

- The running gait cycle 56
- Ground reaction forces 57
- Elastic mechanisms in hopping and running 61
- Hopping robots 64
- Tuned track 66
- Elastic mechanisms to improve running shoes 69
- Leg stiffness changes with body mass 70
- Gait transitions 72
- Bipedal mass–spring model 74
- Kinematics of running 75
- Ground reaction forces and running speed 77

Part II

Production of Movement

- 4 *Muscle Biology and Force* 81**
- Muscle structure 83
 - The cross-bridge cycle 85
 - Sarcomere structure 86
 - Force–length relationship 88
 - Force–velocity relationship 90
 - Muscle activation 93
 - Rate encoding 95
 - Motor unit recruitment 96
 - Electromyography 98
 - Modeling muscle activation dynamics 100
 - Modeling the force–length–velocity–activation relationship 102
- 5 *Muscle Architecture and Dynamics* 105**
- Optimal muscle fiber length, ℓ_o^M 107
 - Muscle fiber pennation angle at optimal fiber length, ϕ_o 109
 - Maximum isometric muscle force, F_o^M 111
 - Maximum muscle contraction velocity, v_{\max}^M 112
 - Tendon slack length, ℓ_s^T 114
 - Measuring muscle-specific parameters 117
 - Hill-type model of muscle–tendon dynamics 121
 - Dimensionless curves 123
 - Computing muscle force with a rigid tendon 124
 - Computing muscle force with a compliant tendon 126
 - Other models of muscle force generation 128
- 6 *Musculoskeletal Geometry* 133**
- Muscle mechanical advantage 134
 - Definition of a muscle moment arm 137
 - Tendon–excursion definition of a moment arm 138
 - Muscle moment arms affect muscle lengths and velocities 143
 - Moment arms of multi-joint muscles 145
 - Measurement and modeling of maximum joint moments 148
 - Muscle architecture, moment arms, and tendon transfer surgery 152
 - Moment arms of muscles with complex actions 154
 - Wrapping up 156

Part III

Analysis of Movement

- 7 *Quantifying Movement* 161**
- Measurement techniques 162
 - Optical motion capture 166
 - Unconstrained inverse kinematics 171

Transformation matrices 174
 Calculating joint angles with unconstrained inverse kinematics 181
 Constrained inverse kinematics 183
 Kinematic model of the shoulder 186
 Assessing anterior cruciate ligament injury risk 188

8 *Inverse Dynamics* 193

Measuring external forces 195
 Center of pressure 197
 Inverse dynamics algorithms 199
 Inverse dynamics with ground reaction forces 201
 Inverse dynamics without ground reaction forces 207
 Verifying dynamic consistency 208
 Joint moments during walking and running 209
 Gait retraining to reduce knee loads and pain 212

9 *Muscle Force Optimization* 217

Biological and numerical optimizers 220
 Static optimization problems solved by inspection 223
 Local methods to solve static optimization problems 226
 Global methods to solve static optimization problems 228
 Muscle forces during walking and running 230
 Estimating joint loads 238
 Dynamic optimization 239
 Muscle coordination during a standing long jump 242

Part IV

Muscle-Driven Locomotion

10 *Muscle-Driven Simulation* 249

Understanding muscle actions during movement is challenging 251
 Creating muscle-driven simulations 254
 Stage 1: Modeling musculoskeletal system dynamics 255
 Stage 2: Simulating movement 259
 Stage 3: Testing the accuracy of dynamic simulations 262
 Stage 4: Analyzing muscle-driven simulations 269
 Software for creating muscle-driven simulations 270

11 *Muscle-Driven Walking* 273

Building and testing simulations of walking 275
 Muscle contributions to ground reaction forces 275
 Muscle actions during the swing phase 280
 Muscle actions in stiff-knee gait 282
 Muscle actions over a range of walking speeds 287

	Muscle actions in crouch gait	292
	Heel-walking and toe-walking	297
	Device-assisted walking	299
12	<i>Muscle-Driven Running</i>	305
	Building and testing simulations of running	307
	Muscle contributions to ground reaction forces	310
	Muscle activity during running	310
	Changes with running speed	312
	Run-to-sprint transition	314
	Muscle actions during the walk-to-run transition	315
	Interaction of arm and leg dynamics	317
	Swinging the legs in running	317
	Foot-strike patterns	318
	Device-assisted running	323
	Springs to enhance running	326
13	<i>Moving Forward</i>	331
	Wearable technology	332
	Physical rehabilitation everywhere	335
	Large-scale experiments	336
	Modern statistics and machine learning	338
	Modeling neuromuscular control to predict movement	340
	Motivating movement	342
	Open science	343
	Taking the baton	347
	Symbols	349
	References	353
	Image Credits	363
	Index	365
